Deformations in the E-field

Increase in sensor depletion voltage

Increase in sensor leakage current

# Radiation Environment at the LHC

10

Units: we normalize damage to that of a 1 MeV neutron and the units are  $n_{\text{eq}}/\text{cm}^2$

Fluence symbol:  $\Phi$

Most of the damage on the inner layers is from charged hadrons. Neutron damage is larger at higher radii (splash-back from calorimeters).

# Radiation Environment at the LHC

11

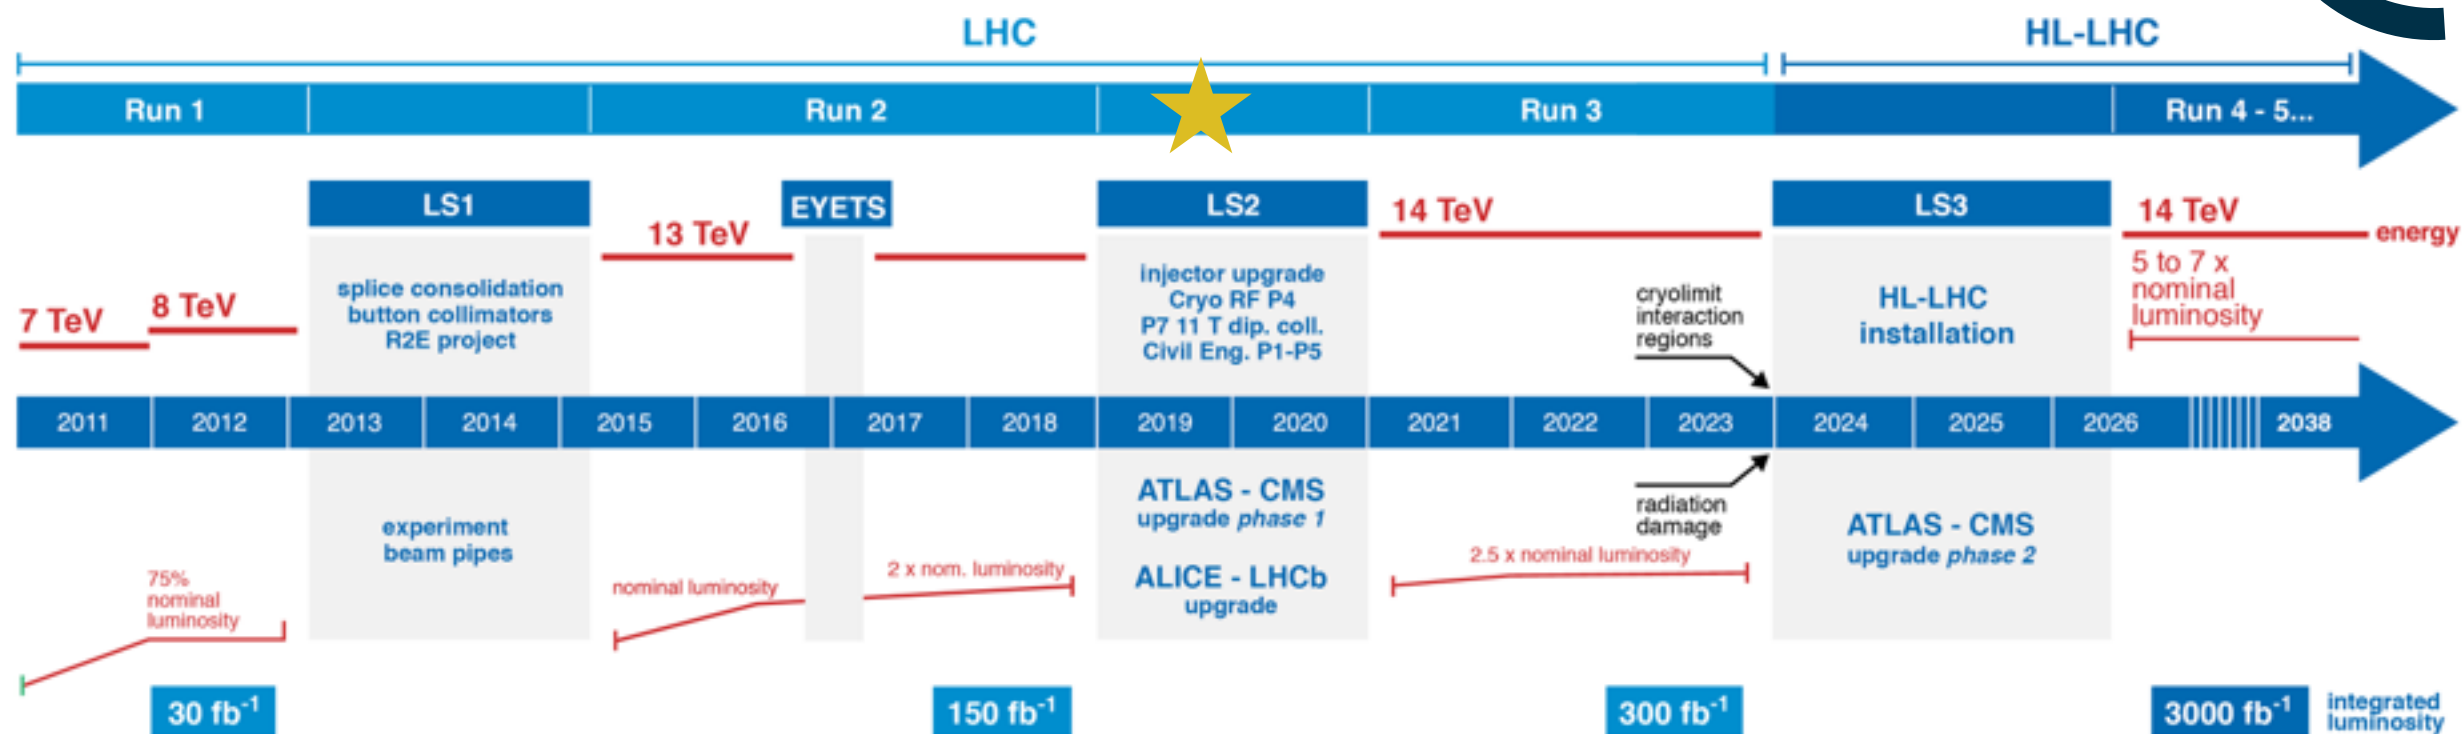

Innermost layer  
= more fluence

Even though the IBL was installed at the start of Run 2, it has surpassed the B-layer in fluence

# Current detector irradiation

12

We have now (★) passed  
 $\Phi = 10^{15} \text{ 1 MeV } n_{eq}/cm^2$  !

We have huge, irradiated detectors  
 to inform Run 3 / HL-LHC.

# Impact on Physics and Performance

13

Charge loss directly effects searches for new highly ionizing particles →

We may be seeing a degradation in position resolution.

It is imperative that radiation damage effects be quantified to inform **operations, offline analysis, and future detector design!**

Pixel position resolution  $[\mu\text{m}]$

# The mysteries

14

**(1)  $|z|$ -dependence  
much stronger in data**

**(2) data > simulation  
past innermost layer**

Try multiple  
methods!

Is it a problem with ...?

# Measuring the fluence

17

Most common method uses the leakage current, as  $I_{\text{leak}} \propto \Phi$

# Measuring the fluence

18

Most common method uses the leakage current, as  $I_{\text{leak}} \propto \Phi$

Depleted volume

Caution: Model assumes uniform space-charge and a small number of effective defect states.

$$\Delta I = (\Phi_{\text{eq}}/L_{\text{int}}) \times V \cdot \sum_{i=1}^n L_{\text{int},i} \cdot \left[ \alpha_I \exp \left( - \sum_{j=i}^n \frac{t_j}{\tau(T_j)} \right) + \alpha_0^* - \beta \log \left( \sum_{j=i}^n \frac{\Theta(T_j) \cdot t_j}{t_0} \right) \right]$$

Measure  
this

We want to  
know this

“The Hamburg Model”

Annealing (depends on  
time ***t*** and temperature ***T***)

*N.B. the coefficients are  
dimensionfull*

# Challenges with leakage measurement

19

$$\Delta I = (\Phi_{\text{eq}}/L_{\text{int}}) \times V \cdot \sum_{i=1}^n L_{\text{int},i} \cdot \left[ \alpha_I \exp\left(-\sum_{j=i}^n \frac{t_j}{\tau(T_j)}\right) + \alpha_0^* - \beta \log\left(\sum_{j=i}^n \frac{\Theta(T_j) \cdot t_j}{t_0}\right) \right]$$

The current has an exponential scaling with  $T$ .

We correct for this, but no consensus on  $E_{\text{eff}}$ .

# Challenges with leakage measurement

20

$$\Delta I = (\Phi_{\text{eq}}/L_{\text{int}}) \times V \cdot \sum_{i=1}^n L_{\text{int},i} \cdot \left[ \alpha_I \exp\left(-\sum_{j=i}^n \frac{t_j}{\tau(T_j)}\right) + \alpha_0^* - \beta \log\left(\sum_{j=i}^n \frac{\Theta(T_j) \cdot t_j}{t_0}\right) \right]$$

JINST 13 T05008 (2018), 1803.00844

The current is not constant  
- have to make a choice  
about what we call “the”  
leakage current.

# Challenges with leakage measurement

21

*Depleted volume*

$$\Delta I = (\Phi_{\text{eq}}/L_{\text{int}}) \times V \cdot \sum_{i=1}^n L_{\text{int},i} \cdot \left[ \alpha_I \exp\left(-\sum_{j=i}^n \frac{t_j}{\tau(T_j)}\right) + \alpha_0^* - \beta \log\left(\sum_{j=i}^n \frac{\Theta(T_j) \cdot t_j}{t_0}\right) \right]$$

Ratios  
between  
layers should  
be constant

2016 we were  
underdepleted!

# Challenges with leakage measurement

22

Depleted volume

$$\Delta I = (\Phi_{\text{eq}}/L_{\text{int}}) \times V \cdot \sum_{i=1}^n L_{\text{int},i}$$

Ratios between  
layers should  
be constant

2016 we were  
underdepleted!

# Challenges with leakage measurement

23

*Depleted volume*

$$\Delta I = (\Phi_{\text{eq}}/L_{\text{int}}) \times V \cdot \sum_{i=1}^n L_{\text{int},i} \cdot \left[ \alpha_I \exp\left(-\sum_{j=i}^n \frac{t_j}{\tau(T_j)}\right) + \alpha_0^* - \beta \log\left(\sum_{j=i}^n \frac{\Theta(T_j) \cdot t_j}{t_0}\right) \right]$$

Ratios between  
layers should  
be constant  
  
for the three  
outer layers,  
remarkably stable

(probably not stable enough to be useful to  
constrain the luminosity, unfortunately)

# Challenges with leakage measurement

24

$$\Delta I = (\Phi_{\text{eq}}/L_{\text{int}}) \times V \cdot \sum_{i=1}^n L_{\text{int},i} \cdot \left[ \alpha_I \exp\left(-\sum_{j=i}^n \frac{t_j}{\tau(T_j)}\right) + \alpha_0^* - \beta \log\left(\sum_{j=i}^n \frac{\Theta(T_j) \cdot t_j}{t_0}\right) \right]$$

We care about the fluence that the detector saw, not the fluence that was good for physics!

...non-trivial to ensure we have all the right conditions information.

# Challenges with leakage measurement

25

$$\Delta I = (\Phi_{\text{eq}}/L_{\text{int}}) \times V \cdot \sum_{i=1}^n L_{\text{int},i} \cdot \left[ \alpha_I \exp \left( - \sum_{j=i}^n \frac{t_j}{\tau(T_j)} \right) + \alpha_0^* - \beta \log \left( \sum_{j=i}^n \frac{\Theta(T_j) \cdot t_j}{t_0} \right) \right]$$

This is the largest source of uncertainty from the measurement.

These coefficients are “known” from various laboratory measurements, but there is a hidden & largely unknown damage factor conversion (more on this later).

(you know how many e.g. protons hit your detector, but not their 1 MeV  $n_{\text{eq}}$ !)

# Leakage current data summary

26

***data ~ sim. for innermost***

***data ~ 1.5 x sim. for other pixels***

***data ~ sim. for strips***

N.B. data > prediction ... important  
to take note for safety factors !

# What about CMS?

Pion induced displacement damage in Silicon

A. Vasilescu & G. Lindstroem

# ...and now the caveats

48

pion silicon damage factors

Not all transport codes use the full range of damage factors.

energy spectra, high eta

Here is a 10% effect from truncating the pion damage factors

(no, it does not induce a 50% shift for the IBL fluence at high  $|z|$ !)

## IBL damage with uncertainties

Now, let's look again at the ATLAS IBL damage prediction vs data plot:

Both **simulations use the RD50 damage constants.**

- ✧ about 60% of the damage is due to pions
- ✧ these pion damage constants have ~30%, mostly correlated, uncertainty
- ✧ Kaon damage (~15%) is pure guess

The measured **leakage current is translated to 1 MeV n Eq.  $\Phi$**  using an  $\alpha$  measured in some neutron spectrum, folded with the (RD50) neutron damage curve

- ✧ these also have ~30%, fully correlated, uncertainty

→ the comparison suggests a difference in z-dependence, but it is inconclusive if the center is underestimated or the large-z region overestimated, or both

Is it a problem with ...?

Damage  
factors

Try multiple  
methods!

Most likely candidate(s)? I'd put my money on physics modeling or damage factors. The latter are quite uncertain, but hard to make a big IZI-dependence.

# Conclusions and outlook

51

The fluence is the key ingredient to radiation damage modeling.

We are still investigating, but in the mean time **have integrated radiation damage into the ATLAS simulation.**

This is allowing us to improve our data analysis and plan for Run 3 and the HL-LHC!

...confirm our strong radius dependence

Simulation vs. Measurements

## Simulation vs. Measurements – Leakage Current Layer 1

- Data granularity: Per sector, not resolved in z
- Temp measured near cooling loops  $\approx -11.5^\circ\text{C}$   
If detector on: Add an offset  $\Rightarrow$  Si at  $\approx -8.5 \pm 2^\circ\text{C}$
- Leakage current simulations are corrected by a factor of 1.0
- Final fluence from FLUKA:  
 $\approx 7.9 \times 10^{14} \text{ n}_{\text{eq}}/\text{cm}^2$

F. Feindt (University of Hamburg)

...and confirm our strong z dependence!

## Z-Dependence of Leakage Current

### Z-Dependence of Leakage Current – Measurements

- HV channels group modules with the same  $\phi$  region in the detector. Individual cables group modules in z. By disconnecting cables from power supply backplanes in the CMS experimental cavern it was possible to isolate individual (layer 1) and groups of modules on same z-positions.
- The detector was at nominal operating temperature with a CO<sub>2</sub> set point of  $-22^\circ\text{C}$ .
- The measurements were taken after the end of the 2018 heavy ion run.

## Z-Dependence of Leakage Current

### Z-Dependence of Leakage Current – Layer 1 - I

- Z-position measured mid of each module
- Measured volume  $0.299\text{ cm}^3$  (16 ROCs)
- Fluence  $7.9 \times 10^{14}\text{ n}_{\text{eq}}/\text{cm}^2$  (FLUKA, at  $z=0$ )  
Dose 41 Mrad (from occupancies)

- Different z,  $I_{\text{leak}}$  differs up to  $\approx 150\text{ }\mu\text{A}$
- Between sectors  $I_{\text{leak}}$  differs up to  $\approx 50\text{ }\mu\text{A}$
- Larger leakage currents towards smaller z, not fully consistent between all measured sectors (one outlier)
